

### To use **CKEditor (3.x)**:

1. Download **CKEditor** from the download website <http://www.ckeditor.net/download>.
2. Extract the download from Step 1 to a new directory, **public/javascripts/ckeditor** in your Hobo application from the website.
3. Add the following file, **load\_ckeditor.js**, to the **public/javascripts** directory of your Hobo application:

```
Event.observe(window, 'load', function() {
  $$('textarea').each(function(elm){
    fldName = elm.name;
    if ( fldName && fldName.length ) {
      oInstance = CKEDITOR.replace(fldName ,
        { toolbar : [ ['DocProps','-','Preview','-','Templates'],
          ['Cut','Copy','Paste','PasteText','PasteWord','-','Print','SpellCheck'],
          ['Undo','Redo','-','Find','Replace','-','SelectAll','RemoveFormat'],
          [],
          '/',
          ['Bold','Italic','Underline','StrikeThrough','-','Subscript','Superscript'],
          ['OrderedList','UnorderedList','-','Outdent','Indent','Blockquote'],
          ['JustifyLeft','JustifyCenter','JustifyRight','JustifyFull'],
          ['Link','Unlink'],
          ['Image','Rule','SpecialChar','PageBreak'],
          '/',
          ['Style','FontFormat','FontName','FontSize'],
          ['TextColor','BGColor'],
          ['FitWindow','ShowBlocks','-','About'] ]}
      );
      oInstance.setData( elm.value );
    }
  });
});
```

NOTE: This replaces all the textareas in the application that have their “name” attribute specified; it also customizes the toolbar. Customize to suit your own needs.

4. Add the following lines of code to **app/views/taglibs/application.dryml**:

```
<extend tag="page">
  <javascript name="ckeditor/ckeditor"/>
  <javascript name="load_ckeditor"/>
</extend>
```
